

ABSTRACT

A pet drinking fountain includes a base having a well housing a water filter and pump. A water tank is mounted on the base, and a drinking dish is disposed beside the tank. The dish communicates with the well in the base allowing water to flow from the it
5 to the well. A duct extends from the pump upward through the tank and discharges water onto the outer surface of the tank from which the water flows into the bowl. The pet can drink from the dish or lap water flowing down the tank surface. When the level of water in the well falls below a prescribed level, water from the tank is discharged into the well. A food dish may also be added to the structure.
